Main Screen (High Fidelity)

</div>

The following image is of the hypothetical main screen that greets the user as they open the application. Once a page is selected, this is inaccessible until the application is closed and reopened.

Quote Assistant and Sign In pages (High Fidelity)

These two pages demonstrate how the user is notified of the selected page: its button is slightly wider and merges with the working page. Note that all the white sub-boxes are for inputs or outputs (depending on what they say) while the <USERNAME> on the "Signed in as" button will display the actual username when someone is signed into the application which is a requirement for accessing the other functions.

Inventory Tracking page (Sketch)

This is an early mockup of the inventory tracking page demonstrating a way for an employee to add to the database wasted or broken product (e.g. bad lights) This allows them to add both the product itself as well as any cost variance due to this (i.e. from duplicate lights) in a conveniently scrollable area that always has one empty row at the bottom. The total extra cost for a specific address specified in the "Address Entry" location is noted down below.

Labor Tracking, Employee Facing or "Work Start and Stop" page (sketch)
This is an early look at the "Work Start and Stop" page featuring a scrollable log as well as a color changing button (green for start, red for stop) and a popup timer while the button is "started".
